Reliable metering of shear-sensitive coatings

An innovative concept from ViscoTec enables coatings which are sensitive to shear to be metered with reliability. The heart of the system is a volumetric dispenser which, independently of viscosity, meters even abrasive products or those including extenders. The only variable which needs to be taken into account is the speed of rotation, resulting in a

constant pulse-free pressure in the supply nozzle at all times. This concept, which has a very gentle action, is also suitable for use with water-borne coatings. As well as stainless steel, various sealing materials are used depending on the application in question, such as "VisChem" with solvent-borne coatings. The manufacturers have given particular priority to designing a unit which is easy to clean and has no dead spaces.
